## How much does your parcel weigh?

## Cubing guide

You'll need to know your parcel's actual weight and it's cubic weight, as the delivery rate is calculated on whichever is the greater.

The cubic conversion rate is 200 kg per cubic metre, so cubic weight = H x W x L x 200.

1. Convert measurements to metres.

## Example: if a parcel is...

Height $80 \mathrm{~cm}>0.8 \mathrm{~m}$
Width $50 \mathrm{~cm}>0.5 \mathrm{~m}$
Length $15 \mathrm{~cm}>0.15 \mathrm{~m}$
2. Multiply the height $x$ width $x$ length $x$ cubic conversion (200) to get cubic weight.

Example: (H) $0.8 \mathrm{~m} \times(\mathrm{W}) 0.5 \mathrm{~m} \times(\mathrm{L}) 0.15 \mathrm{~m} \times 200=12 \mathrm{~kg}$
3. So, if the actual weight of this parcel was 5 kg and the cubic weight was 12 kg , the greater weight of 12 kg is used to calculate the price.
